GopalAI Assistant

Complete Android Personal AI Agent &
Business Management System

Master Development Prompt

Android • React Native + Expo • Hindi / English / Hinglish • Offline + Cloud • Background Tasks

Key constraints
- Zero dummy data
- No Profit & Loss features or calculations
- Owner-only access
- Three separate businesses plus consolidated reporting
- Background work within Android platform limits

GOPALAI ASSISTANT

Complete Android Personal AI Agent & Business Management System

Build a production-oriented Android application named **GopalAI Assistant** using React Native and Expo.

The application must function as a personal AI assistant, voice-controlled task automation agent and complete business management system for:

- Jain Sweets
- Paan Bai Canteen
- Kesarwadi Canteen

The application must prioritize real functionality, data accuracy, privacy, offline operation and background task execution.

1. FIXED PROJECT CONFIGURATION

- Platform: Android only.
- Development: Mobile-phone-friendly development workflow.
- Framework: React Native + Expo.
- Programming language: JavaScript.
- Database: SQLite for local storage.
- Cloud: Supabase for optional synchronization.
- AI: LLM API through a secure backend.
- Interaction: Voice + Text.
- Languages: Hindi, English and Hinglish.
- Access: Single owner account.
- Themes: Dark and Light.
- Background operation: Android-compatible background task support.
- Application name: GopalAI Assistant.

2. STRICT ZERO-DUMMY-DATA POLICY

This requirement is mandatory.

DO NOT create:

- Fake sales, expenses, income or stock quantities.
- Fake inventory items, suppliers, customers or payments.
- Fake transactions, business reports, charts or analytics.
- Sample financial balances or pre-filled business records.

All dashboards, reports, tables, charts and totals must be generated exclusively from actual user-entered and saved database records.

For a new installation:

- All financial totals must initially show ■0.
- Lists must display proper empty states.
- Charts must show an empty state.

- Stock must show no recorded items.
- Supplier lists must be empty.
- Pending payment totals must be ■0.
- Do not create automatic demo entries.

Use clear messages such as “No transactions recorded yet,” “No inventory items added,” and “No supplier records available.”

Never use hardcoded numbers as actual financial information.

3. PERSONAL AI ASSISTANT

Implement:

- Personal income and expense tracking.
- Money received and money paid.
- Personal balance tracking.
- Receivables and payables.
- Contact lookup.
- Phone calls through Android-supported intents.
- Opening installed applications where supported.
- Internet searches.
- Reminders and notifications.
- Calendar events.
- Notes and voice notes.
- Personal task management.
- Daily, monthly and yearly summaries.

Example commands:

- “Aaj 500 rupaye kharch hue.”
- “Meri income mein 10000 add karo.”
- “Ramesh ko call lagao.”
- “YouTube open karo.”
- “Kal subah 8 baje reminder lagao.”
- “Mera monthly expense batao.”

4. THREE SEPARATE BUSINESS SYSTEMS

Create three independent business accounts:

A. Jain Sweets

B. Paan Bai Canteen

C. Kesarwadi Canteen

Each must maintain separate sales, expenses, purchases, inventory, suppliers, supplier payments, receivables, payables, staff, attendance, salary records and reports.

Provide a consolidated dashboard that combines real records from all three businesses without mixing their individual accounts.

5. SALES MANAGEMENT

- Add daily sales through voice or text.
- Record amount, date, business and payment method.
- Support cash, UPI, online and credit transactions.
- Record product-wise quantity and price when supplied.
- View sales history.
- Filter by day, month and year.
- Generate business-wise sales reports.
- Generate combined sales reports.

6. EXPENSE AND PURCHASE MANAGEMENT

Support expense categories: raw materials, electricity, rent, staff salary, transportation, packaging, maintenance and other expenses.

Purchase records must include item name, quantity, unit, purchase amount, supplier, business, date and payment status.

Do not automatically assume that every purchase is fully paid.

7. INVENTORY MANAGEMENT

Implement:

- Add, edit and delete inventory items.
- Stock quantity and units.
- Minimum stock levels.
- Purchase history and stock movement history.
- Stock consumption and wastage.
- Expiry dates.
- Low-stock alerts and reorder suggestions.
- Business-wise inventory.

Only update stock through validated purchase, consumption, sale or adjustment records. Never guess quantities.

8. SUPPLIER AND PAYMENT MANAGEMENT

Maintain supplier accounts with name, contact, business association, purchase history, payments made, outstanding payable amount, due dates and payment reminders.

Also manage receivables and customer credit records.

Do not record a payment as completed until the owner confirms the transaction.

9. STAFF MANAGEMENT

Implement staff profiles, attendance, salary records, advance payments, assigned tasks, contact information and staff history.

10. STRICT ACCOUNTING RESTRICTION

PROFIT AND LOSS MUST NOT EXIST ANYWHERE IN THIS APPLICATION.

Do not implement:

- Profit calculation.
- Loss calculation.
- Net profit.
- Gross profit.
- Profit margin.
- Profit and loss dashboard.
- Profit and loss charts.
- Profit and loss reports.

Provide only sales totals, income totals, expense totals, purchase totals, amounts received and paid, cash and bank balances, receivables, payables, transaction history and stock reports.

Never display sales minus expenses as profit.

11. INTELLIGENT AI AGENT

Build an action-oriented AI agent with this workflow:

1. Receive voice or text command.
2. Convert speech into text.
3. Identify the user's language.
4. Understand intent.
5. Extract amounts, dates, quantities and business names.
6. Identify the appropriate action.
7. Validate required fields.
8. Ask for missing information.
9. Ask for confirmation when necessary.
10. Execute the appropriate application function.
11. Save the result in SQLite.
12. Synchronize to cloud when permitted and online.
13. Return a factual completion message.

Example: “Jain Sweets mein aaj 12000 ki sale add karo.” Identify the business and transaction, extract the amount, ask for required missing information, save the transaction, update the dashboard and confirm successful storage.

The AI must never claim an operation succeeded unless the database or relevant Android action confirms success. Never invent missing information or financial records.

12. BACKGROUND AI AGENT — MANDATORY

The application must support background operation when the user minimizes the application, switches apps or locks the phone screen, within Android's rules and limits.

Required capabilities:

A. Background reminders

- Scheduled reminders.
- Payment due notifications.
- Low-stock notifications.
- Important task notifications.

B. Background synchronization

- Sync locally saved records when internet becomes available.
- Retry failed synchronization safely.
- Prevent duplicate transaction uploads.
- Maintain an offline sync queue.

C. Background reports

- Schedule daily and monthly summaries.
- Notify the owner when reports are ready.

D. Background monitoring

- Monitor scheduled tasks.
- Process permitted scheduled automation.
- Maintain notification history.

E. Voice activation

- Provide microphone-based voice interaction while the application is open.
- Investigate supported Android foreground-service options for optional background listening.
- Never secretly record conversations.
- Never continuously listen without explicit consent and visible indication.
- Respect Android microphone permissions and battery restrictions.

F. Persistent tasks

- Save pending tasks locally.
- Recover unfinished synchronization after app restart.
- Reschedule supported reminders after device reboot where Android permissions allow.

Technical requirements

Use Expo Notifications, Expo Background Task and Expo Task Manager where supported. Use an appropriate native Android implementation for foreground services when continuous operation is genuinely required. Use WorkManager or equivalent native scheduling for reliable deferrable work, and maintain a secure local task queue.

Android limitations

Do not promise unrestricted 24/7 execution. Android may suspend processes, restrict microphone access, delay scheduled jobs or terminate applications under battery management. Use foreground services only for eligible, user-visible operations with proper notifications and permissions. If the application is force-stopped, background tasks may not run until the user opens it again. Implement recovery and clear status indicators.

13. VOICE INTERFACE

Create an animated AI voice orb, microphone button, voice input, text input, AI response, text-to-speech, stop-speaking button, conversation history and processing indicator.

Support Hindi, English and Hinglish.

14. ANDROID PERSONAL AUTOMATION

Implement supported actions: open installed apps, initiate phone calls, search the internet, open maps, create reminders, share reports, prepare messages and send messages only through supported integrations and with owner confirmation.

Do not bypass Android security or permissions.

15. DAILY, MONTHLY AND YEARLY REPORTS

Generate reports from actual database records only.

Include sales, expenses, purchases, payments received and made, receivables, payables, stock changes, supplier statements, staff records and task completion summaries.

Provide individual business reports, combined business reports, personal financial reports, PDF export and Excel export. Never include profit/loss calculations.

16. AI SUGGESTIONS

Suggestions may include:

- Sugar stock is running low.
- Supplier payment is pending.
- Monthly expenses have increased.
- Sales have changed compared with the previous month.
- Some items are approaching expiry.
- A supplier order may be required.
- A payment reminder is due.

Suggestions must be based on actual saved data.

17. UI DESIGN

Create a premium modern interface:

- Default dark theme and optional light theme.
- Navy/black backgrounds with elegant gold accents.
- Modern typography, rounded cards and smooth animations.
- Responsive mobile layout.
- Animated AI orb.
- Accessible buttons and clear empty states.

Required screens:

1. Splash.
2. Owner login.
3. Home dashboard.

4. AI assistant.
5. Personal finance.
6. Tasks and reminders.
7. Jain Sweets dashboard.
8. Paan Bai Canteen dashboard.
9. Kesarwadi Canteen dashboard.
10. Combined dashboard.
11. Sales.
12. Expenses.
13. Purchases.
14. Inventory.
15. Suppliers.
16. Payments.
17. Staff.
18. Reports.
19. Notifications.
20. Settings.
21. Privacy and backup.

18. DATABASE ARCHITECTURE

Create structured tables for:

- users
- businesses
- personal_transactions
- sales
- sale_items
- expenses
- purchases
- purchase_items
- inventory_items
- stock_movements
- suppliers
- supplier_payments
- receivables
- payables
- customers
- staff
- attendance
- salaries
- tasks
- reminders

- notes
- notifications
- reports
- ai_command_history
- background_jobs
- sync_queue
- app_settings

Use unique IDs, timestamps, database transactions, validation and proper business IDs. Use idempotency keys to prevent duplicate financial entries.

19. SECURITY AND PRIVACY

- Owner-only access.
- PIN and biometric authentication.
- Secure storage of credentials.
- No API keys in frontend.
- Encrypted cloud communication.
- Secure database backup.
- Local-first data handling.
- Explicit cloud synchronization settings.
- Confirmation before sensitive actions.
- No unauthorized recording.
- No automatic financial transfers.
- Backup and restore functionality.

20. DEVELOPMENT PHASES

Phase 1: UI, navigation and themes.

Phase 2: SQLite and permanent personal accounting.

Phase 3: Three independent business accounts.

Phase 4: Sales, expenses and purchases.

Phase 5: Inventory and suppliers.

Phase 6: AI agent and secure task execution.

Phase 7: Hindi and English voice.

Phase 8: Android automation.

Phase 9: Background task system and notifications.

Phase 10: Reports and cloud synchronization.

Phase 11: Security, testing and Android APK build.

For every phase:

- Provide complete working code.
- Specify exact filenames.
- Provide installation instructions.

- Use actual database operations.
- Test functionality.
- Do not create fake financial records.
- Do not remove previously working features.
- Explain Android limitations.
- Maintain compatibility with selected Expo and Android versions.

21. FINAL ACCEPTANCE CRITERIA

The application is complete only when:

1. Financial records persist after closing and reopening the app.
2. All three businesses have separate records.
3. Voice and text commands execute validated actions.
4. No dummy data appears.
5. Offline accounting works.
6. Cloud sync works when enabled.
7. Background reminders and eligible scheduled jobs work.
8. Reports reflect actual saved records.
9. Android permissions are handled correctly.
10. Profit and loss functionality does not exist.
11. Owner confirmation is required for sensitive actions.
12. The Android application can be built and installed.

Build a real, usable GopalAI Assistant, not a static prototype or a chatbot that only pretends to execute tasks.
